

Bayrol, Baquacil and Softswim Brand Chemistry:

(Floatron will not work with the above chemicals)

Notes for terminating Bayrol/ Baquacil or Softswim Brand Chemistry:

1. Easiest, simplest and best – drain the pool and refill with fresh water. If unable to drain completely, drain as much as you can and top off with fresh water.
2. Super chlorinate with triple dose chlorine shock. Apply at sundown; run pump for a couple of hours, then turn off for the night.
3. Yellow dust will settle over night to the bottom. Vacuum up in the morning, but without stirring up the water.
4. Repeat the next evening, and again if necessary, until no fallout exists in the morning.
5. Once cleared of old chemistry, begin floating your floatron as per instructions. Once the chlorine falls to 1ppm or less, begin adding more chlorine to keep the residual at approx 1ppm. Ensure pH 7.2 – 7.8; Adjust as necessary.

Notes:

- i. Filter media may need changing if a few years old.
- ii. Combination of Baquacil/ Softswim/ Bayrol with chlorine can result in a brownish scum at surface
- iii. Normally all pool water is drained. However we have one client who was unable to drain and got no yellow dust.
